

N prisoners at least N times to the switch room.

① When the initial state of the switch is off, assign one person as the counter. His counter is 1 at first.

The solution is:

When the counter person enters the room, if the switch is off, he will do nothing, otherwise increment his count.

Counter $\left\{ \begin{array}{l} \text{on} \rightarrow \text{turn it off and count}++ \\ \text{off} \rightarrow \text{continue} \end{array} \right.$

Others $\left\{ \begin{array}{l} \text{on} \rightarrow \text{continue} \\ \text{off} \rightarrow \text{first time off, turn it on} \\ \text{otherwise do nothing} \end{array} \right.$

When the counter person reaches P , can make an announcement that all persons have already entered the room.

If the initial state of switch is unknown

Counter $\left\{ \begin{array}{l} \text{on} \rightarrow \text{turn it off, count}++ \end{array} \right.$

if $\text{count} \geq 2p-1$
 if on
 off \rightarrow continue

others
 if on \rightarrow continue
 if off \rightarrow first two times, turn it on

Finally, when count reaches $2p-1$, announce that all the persons have already entered the room.
